The present invention relates to a new probe comprising or consisting of CC an immobilised phosphatidy acid derivative attached on to a solid CC support, or a phosphatidic acid (PA) functionalised solid support. The control of the invention is useful in an assay method for identifying a protein that binds to the probe. The invention is also cone type of phosphatidic acid and/or phosphatidic acid and/or isolating protein cC assay is also useful for detecting, measuring, identifying and/or isolating protein cC assay is also useful for detecting, measuring, identifying and/or phosphotiositide binding protein cC assay is also useful for detecting, measuring, identifying and/or the control of the phosphatidic acid and/or phosphotnositide-binding proteins in cc at test sample, to detect and/or measure the ability of an agent, applied test sample, to agonise or antagonise protein-probe binding protein-containing cd detect and/or measure the ability of an agent, applied to the probe, to consphoinosit or antagonist or antagonist or protein-probe binding. The probe is useful for cc identifying an agonist or antagonist or protein-probe binding. The probe is useful for identifying and in a single step high throughput screen of candidate componist and/or antagonist. The invention is also useful for identifying for probe is useful as an important research tool in fundamental research cc encodes the human myosin-IF protein MYOIF of the invention.

      The invention relates to the isolation of genes AAF32757-F32803 47 human secreted profesins AAB64349-B864594. The genes can be use generate fusion proteins by linking to the gene for the human immunoglobulin G Fc portion (SEQID1) for increasing the stabilit the fusion protein as compared to the human protein only. The gene for the human protein only.

                                                                                                                                                                                                                                   composition comprising these polynucleotides are useful as a high throughput method for detecting altered expression of one or more polynucleotides in a sample. The polynucleotides can be used in the diagnosis of disorders associated with foam cell development such as atherosclerosis, cerebral stroke, and cardiovascular disorders such as coronary artery disease. The polynucleotide sequences can also be used as PCR primers and probes. The polynucleotides of the invention are also useful in gene therapy. AAS94746-AAS95021 represent the human polynucleotide sequences of the invention which are differentially expressed during foam cell differentiation.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           2103

Sequence 2, Application US/09172422A

Patent No. 6300485
GENERAL INFORMATION:
APPLICANT: Adams, Arwen E.
APPLICANT: Chiu, Choi Ying
APPLICANT: Chiu, Choi Ying
APPLICANT: Gorman, Susan W.
APPLICANT: Leng, Song
APPLICANT: Leng, Song
APPLICANT: Sheffield, Val
APPLICANT: Welch, Juliet
TITLE OF INVENTION: CHANKEL-15 (CNGC-15) POLYNUCLEOTIDE GATED
TITLE OF INVENTION: COMPOSITIONS, METHODS, AND USES THEREOF
CURRENT APPLICATION NUMBER: US/09/172,422A
CURRENT FILING DATE: 1998-10-14
CURRENT FILING DATE: 1998-10-14
SOFTWARE: FastSEQ for Windows Version 3.0
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       ; LENGTH: 8473
; TYPE: DNA
; ORGANISM: Homo sapien
